

Release notes

Version 0.5

New features and bug fixes

GUI designed for and almost everything implemented before database connection for following parts:

- Listing of available workouts
- Creating new workouts
- Editing existing workouts
- Register new results for exercises (reps, weight, time, distance depending on type of exercise)
- Listing of available exercises
- Creating new exercises
- Editing exercises

Known bugs

- Main menu is distorted on ldpi devices.
- By choosing Exercises from main menu and selecting “Add exercise”, enter a name in the dialog box and select add will show a new activity with the information about the exercise. If you select cancel, the application will show the list of exercises again. If you press “add exercise” again, the name you just entered will still be there.
- Layout of buttons and design of dialogs is not uniform through the whole application.

Limitations

- Database is implemented but no connection between GUI and the database, so listed workouts and exercises is just dummy items for testing.
- Only workouts and exercises view is implemented.
